

DeNovo Constructors, a full-service remedial construction company servicing commercial, federal and Fortune 500 companies has begun operations under the DeNovo Group banner. Our team has the expertise to provide our clients with the most cost-effective and safest solution to their impaired facilities. DeNovo Constructors provides the following services:

- Soil excavation
- Site backfill and restoration
- Transportation and disposal
- Soil/waste relocation, landfill construction and capping
- Facility decontamination and demolition
- Civil Construction
- Demolition
- Asset recovery
- System installation and O&M
- Sediment removal
- Residential soil removal
- In-Situ soil stabilization
- Wetlands restoration

The DeNovo Team

The DeNovo team is proud to have established itself as an industry leader in the liability transfer and management of environmentally impaired properties and facilities. We have recently expanded our business into remedial construction contracting to capitalize on our team's deep experience and expertise in such projects. Our recent and past successes are due largely to the broad range and depth of experience for the key members of the DeNovo team. Our staff includes project managers, safety specialists, field technicians, and remedial experts. The expertise of the team differentiates DeNovo from other firms with our hands on remediation and construction experience as well as our capabilities in project finance and asset management. This superior level of service will be brought to bear on each project site to ensure the most cost-effective and safe remedial measures are implemented to successfully complete each project.

The DeNovo Constructors Team Experience:

- **Demolition and Decontamination** - A 300 acre former GST Steel site with 800,000 square feet of buildings was acquired out of bankruptcy in 2002. In addition to the remediation and closure activities at the site, the project consisted of a complex dismantlement, decontamination, demolition, and asset recovery/recycling effort on several of the mill process buildings.
- **Refinery Remediation** - remediation and construction services for this multitask project. Services performed included RCRA corrective action management unit (CAMU) construction, underground piping removal, coke fines remediation, hazardous soil remediation, and stream restoration.
- **Soil Removal** - Removal of lead-contaminated soil at residential locations. Performed soil excavation, materials handling, transportation of waste materials, backfilling and complete site restoration of all areas where contaminated soil was removed.
- **Capping/Soil Cover** - Construction of a multi-layered landfill cap consisting of a soil cushion, HDPE primary cover, sand drainage, root zone, and vegetative layers.
- **Water Resources** - Excavation, staging, and load-out of PCB contaminated river sediments. The work required river flow diversion, temporary cofferdams, dewatering, collection and on-site treatment of contact waters.
- **Drum Removal** - Project Manager, Superfund Site Drum Removal. Over 25,000 drums of hazardous waste were removed from an abandoned landfill. This project also involved extensive material processing and disposal activities.
- **Soil Excavation and Transportation** - Removal of hazardous waste and transportation of contaminated. Site soils were contaminated with volatile organic compounds (VOCs), particularly trichloroethene (TCE), and required excavation and removal.
- **Mine Closure** - Excavation and consolidation of low-level radiation contaminated soil. Included were a low permeable soil lining of the landfill and multi-layer soil and armor rock cap.
- **Soil Stabilization** - Provided in-situ stabilization (ISS) at a Superfund site. This project was a new Brownfield redevelopment initiative and was surrounded by upscale residential neighborhoods.
